

Project Overview

Scottsdale Fire & EMS teams need clear, timely performance insight for operational decisions. Our platform transforms monthly incident data into interactive KPIs and exportable reports — enabling faster, evidence-based decisions.

The Problem

Current solutions are either expensive dashboards or slow. As a result Fire/EMS personnel have delayed visibility into operational trends, high manual effort for recurring analysis, and averages hide where response delays actually occur.

Impact: Limited insight into delays, resource use, and mutual-aid reliance

Our Solution & Key Innovation

We developed a Fire/EMS KPI analytics platform that ingests CSV/XLSX incident data, performs automated validation, and computes key performance metrics through an interactive dashboard with region and date filtering, role-based access, and PDF export for reporting. The system introduces deeper operational insight through response-time decomposition (call processing, turnout, and travel), percentile-based metrics (P90) for more realistic performance evaluation, and mutual-aid analysis comparing Scottsdale and non-Scottsdale utilization. Built-in, configuration-driven data quality checks ensure reliability before data is stored, while a customizable analyst workspace allows flexible visualization of trends. The platform is also designed for future expansion with AI-assisted summaries and Q&A to explain KPI patterns in plain language.
